

Linux Navigation & File Management Summary

Linux Navigation

What I Learned

Linux navigation is how you move around the file system using the terminal. I learned how to find my current location, move between directories, and navigate through project folders.

Commands Used

```
pwd
ls
cd
cd ..
cd folder-name
```

What Each Command Does

- `pwd` → Shows the current directory path.
- `ls` → Lists files and folders.
- `cd folder-name` → Moves into a folder.
- `cd ..` → Moves up one directory level.

Challenges I Faced

The `cd` command was the most difficult part at first because I sometimes got confused about which directory I was in. Using `pwd` and `ls` helped me understand the file structure better. After practicing several times, moving between directories started to feel natural.

File Management

What I Learned

I learned how to create, view, rename, copy, move, and delete files and directories using Linux commands.

Commands Used

```
mkdir
touch
echo
cat
cp
mv
rm
```

What Each Command Does

- `mkdir` → Creates a new directory.
- `touch` → Creates a new file.
- `echo` → Writes text into a file.
- `cat` → Displays file contents.
- `cp` → Copies files.
- `mv` → Moves or renames files.
- `rm` → Deletes files.

Challenges I Faced

The `mv` command was the most challenging. I sometimes tried moving files while in the wrong directory or used an incorrect destination path. After practicing with projects such as **Server-Cleanup** and **Cloud-Home-Lab**, I became more confident using it.

Projects Completed

- Study-Lab
- Server-Cleanup Project
- Cloud-Home-Lab
- Cloud-Engineer-Lab

Key Takeaway

I can now confidently navigate the Linux file system, create and organize files and folders, move around directories, and manage files using core Linux commands.
